

Occupational Health Speaker Series

EHS 668/IOE 837

Christopher Friese, PhD, RN, AOCN(R), FAAN

Speaking on

Occupational Exposure to Antineoplastics in the Ambulatory Oncology Setting: A Pilot Study

The health hazards to workers who handle antineoplastic agents are well-known, yet little is known regarding the contextual factors that increase the risk of exposure. In seminar, we will review the results of a pilot study to measure and characterize occupational exposure to antineoplastics for nursing personnel employed in ambulatory oncology settings, where up to 80% of cancer care is delivered. Policy and research implications for this high-volume, high-risk setting will be discussed.

All interested persons are welcome to attend.
